Linisol Luchttechniek

A subdivision of Linisol Isolatie BV

Linisol Luchttechniek is the latest activity of Linisol Isolatie BV. Linisol Luchttechniek has been active in the air technology sector, which is closely related to insulation, since 2006, with a focus on prefabricated activities.

Linisol luchttechniek provides structural design, calculations, delivery and prefabrication, as well as the assembly and fine-tuning of complete mechanical ventilation and heat re-absorption installations. Linisol is also your preferred partner for delivering and installing CLV-systems (systems for supplying air and extracting combustion gases)

In addition, we can apply the correct insulation and fire resistance covering for these installations.

We perform these activities in newly built as well as renovation projects. Industrial air extraction is also among our activities.

We also perform annual maintenance on heat re-absorption and mechanical ventilation systems. Regular periodical maintenance significantly improves the life expectancy of the installation and the quality of the interior atmosphere, whilst proportionally reducing the likelihood of faults. At the same time this translates into reduced operating costs and energy savings (certainly not unimportant in current times).

The number of contractors and installation companies that make use of our air technology services is constantly growing.

Our aim is to further expand these activities within the Linisol Group through our approach which emphasises the importance of fulfilling our agreements and delivering a high standard of service.
